

3) Initial questions and answers, Part 2

Now you'll address a more realistic (and complex!) scenario. To answer this question, you'll need to pull information from *three* different tables! This syntax very similar to the case when we have to join only two tables. For instance, consider the three tables below.

owners table				pets table				treats table		
ID	Name	Age	Pet_ID	ID	Name	Age	Animal	ID	Treat	Pet_ID
1	Aubrey Little	20	1	1	Dr. Harris Bonkers	1	Rabbit	1	Chicken	5
2	Chett Crawfish	45	3	2	Moon	9	Dog	2	Beef	2
3	Jules Spinner	10	4	3	Ripley	7	Cat	3	Carrot	1
4	Magnus Burnsidess	9	2	4	Tom	2	Cat	4	Fish	3
5	Veronica Dunn	8	NULL	5	Maisie	10	Dog	5	Bugs	6

We can use two different **JOINS** to link together information from all three tables, in a single query.

```
query = """
SELECT o.Name AS Owner_Name,
       p.Name AS Pet_Name,
       t.Treat AS Fav_Treat
FROM `bigquery-public-data.pet_records.pets` AS p
FULL JOIN `bigquery-public-data.pet_records.owners` AS o
  ON p.ID = o.Pet_ID
LEFT JOIN `bigquery-public-data.pet_records.treats` AS t
  ON p.ID = t.Pet_ID
"""
```

Owner_Name	Pet_Name	Fav_Treat
Aubrey Little	Dr. Harris Bonkers	Carrot
Magnus Burnsidess	Moon	Beef
Chett Crawfish	Ripley	Fish
Jules Spinner	Tom	NULL
Victoria Dunn	NULL	NULL
NULL	Maisie	Chicken

With this in mind, say you're interested in understanding users who joined the site in January 2019. You want to track their activity on the site: when did they post their first questions and answers, if ever?

Write a query that returns the following columns:

- `id` - the IDs of all users who created Stack Overflow accounts in January 2019 (January 1, 2019, to January 31, 2019, inclusive)
- `q_creation_date` - the first time the user posted a question on the site; if the user has never posted a question, the value should be null
- `a_creation_date` - the first time the user posted a question on the site; if the user has never posted a question, the value should be null

Note that questions and answers posted after January 31, 2019, should still be included in the results. And, all users who joined the site in January 2019 should be included (even if they have never posted a question or provided an answer).

The query from the previous question should be a nice starting point to answering this question! You'll need to use the `posts_answers` and `posts_questions` tables. You'll also need to use the `users` table from the Stack Overflow dataset. The relevant columns from the `users` table

are `id` (the ID of each user) and `creation_date` (when the user joined the Stack Overflow site, in DATETIME format).
